

Microsoft Teams Meeting Transcript

Meeting: Project Kickoff - Legal Document Assistant App (US Market) **Date:** June 13, 2026 **Duration:** 00:38:12 **Attendees:** - Sarah Mehta - Product Owner - Mike Donovan - Business Lead - Priya Nair - Business Analyst - David Cohen - Architect - Lena Park - Tech Lead / Developer

[00:00:05] Sarah Mehta (Product Owner): Thanks everyone for joining. Let's kick off the discussion for our new app — essentially a platform that helps users generate rental agreements and navigate legal documentation for college admissions, DMV license applications, and SSN applications, all tailored to the US market. Mike, can you start with the business context?

[00:00:32] Mike Donovan (Business Lead): Sure. We're seeing a huge demand from immigrants, international students, and young adults who find these processes confusing — especially first-generation renters or students who don't know which forms apply to their state. Our value proposition is to simplify and guide users through these four document categories with state-specific templates and checklists.

[00:01:20] Sarah Mehta (Product Owner): Got it. So from a product standpoint, I'm thinking we need four core modules: Rental Agreement Generator, College Admission Document Checklist, DMV License Application Guide, and SSN Application Assistant. Priya, what have you found in terms of requirements for each?

[00:02:05] Priya Nair (Business Analyst): I've done some preliminary research. For rental agreements, requirements vary significantly by state — some states mandate specific disclosures like lead paint, security deposit limits, etc. So we'll need a state-selector that dynamically changes the template clauses.

[00:03:10] Priya Nair (Business Analyst): For college admissions, it's less about generating documents and more about guiding users through what's needed — transcripts, visa documents for international students, FAFSA forms, recommendation letters. We may need to integrate checklists rather than generate documents ourselves.

[00:04:22] Priya Nair (Business Analyst): DMV license applications — each state has its own DMV portal and form requirements. We can't submit on their behalf, but we can provide a step-by-step wizard: what documents to bring, how to fill the form, appointment booking links.

[00:05:30] Priya Nair (Business Analyst): SSN applications are federal, so the form (SS-5) is standard, but we should help users fill it out correctly and tell them which documents they need to bring to the Social Security office, since walk-in submission is required.

[00:06:40] David Cohen (Architect): That's helpful. Given the variability — especially for rental agreements which need state-specific legal clauses — I'm thinking we need a templating engine that's data-driven. We could store templates with placeholders and conditional sections, where the conditions depend on the state and user inputs.

[00:07:50] Sarah Mehta (Product Owner): Right, and we'll need to keep these templates updated as laws change. Who's responsible for legal accuracy?

[00:08:05] Mike Donovan (Business Lead): We'll need to partner with a legal review service or hire a compliance consultant for the rental agreements specifically, since those are legally binding documents. The other three are more "guidance" tools, so the legal risk is lower — we're not generating binding documents, just helping users prepare.

[00:09:15] Priya Nair (Business Analyst): That's an important distinction. I'll document that as a requirement — rental agreements need a "Reviewed by Legal" flag and disclaimer, while the other three modules are informational/guidance only with appropriate disclaimers stating we're not a government entity and not providing legal advice.

[00:10:40] David Cohen (Architect): From an architecture perspective, I'm picturing a modular setup: - A Document Generation Service for rental agreements (template engine + PDF generation) - A Content/Checklist Service for college admissions, DMV, and SSN — basically a CMS-backed guidance engine - A User Profile Service to store user info (state, user type — student/renter/etc.) so we can personalize content - An Integration layer for things like DMV appointment booking links or state-specific portal redirects

[00:12:30] Lena Park (Tech Lead): On the tech side, for the rental agreement generator, I'd suggest using a templating library like Handlebars or a PDF generation library that supports conditional logic — something like react-pdf or a server-side solution with PDFKit. We'll need a structured JSON schema per state defining which clauses are mandatory vs optional.

[00:13:50] Lena Park (Tech Lead): For the checklist modules, a simpler CMS-driven approach works — maybe even a headless CMS like Contentful, so the BA team or content writers can update guidance without needing a deploy.

[00:15:00] Sarah Mehta (Product Owner): Good point. Priya, can you also look into whether we need multi-language support? A lot of our target users may not be native English speakers.

[00:15:20] Priya Nair (Business Analyst): Yes, I'll add that as a requirement — at minimum Spanish, given the demographic for rental and SSN applications. I'll do a quick survey of common languages by use case.

[00:16:45] Mike Donovan (Business Lead): Also, from a monetization angle — I think the rental agreement generator could be a paid feature (since it's a tangible deliverable), while the checklists/guidance tools could be free to drive user acquisition, with maybe a premium tier for personalized step-by-step support or document storage.

[00:17:30] Sarah Mehta (Product Owner): I like that. Let's call that the freemium model — checklists and guidance free, document generation and storage premium.

[00:18:50] David Cohen (Architect): One more consideration — data privacy. SSN applications involve highly sensitive PII. Even if we're not submitting on the user's behalf, if we're helping them fill out forms with their SSN-related info, we need strong encryption, and probably shouldn't store SSN data at all — just guide them through it without persisting sensitive fields.

[00:20:10] Lena Park (Tech Lead): Agreed. We can design the SSN module to be stateless on the backend — all data entry happens client-side, nothing sensitive gets sent to our servers unless absolutely necessary, and even then it should be encrypted at rest and in transit, with strict retention policies.

[00:21:40] Sarah Mehta (Product Owner): Great, let's capture that as a non-functional requirement — PII handling and data minimization, especially for the SSN module.

[00:23:00] Priya Nair (Business Analyst): I'll compile all of this into a requirements doc — I'll structure it by module (Rental, College Admission, DMV, SSN) with functional requirements, then a separate section for cross-cutting concerns like state-based logic, legal disclaimers, multi-language support, and data privacy.

[00:24:15] David Cohen (Architect): And I'll draft a high-level architecture diagram based on the modular breakdown we discussed, along with a tech stack recommendation.

[00:25:30] Sarah Mehta (Product Owner): Perfect. Let's reconvene next week — Priya and David, if you can have your docs ready by Wednesday, we can review together and refine the scope before moving to design and sprint planning. Mike, can you also start outreach to potential legal consultants for the rental agreement module?

[00:26:50] Mike Donovan (Business Lead): On it.

[00:27:05] Sarah Mehta (Product Owner): Great, thanks everyone — let's sync next week.

[00:27:20] — Meeting Ended —
